

## EXOplanet Transit Interpretation Code (EXOTIC) Instructions: How to Run the Code

### I. Using the Terminal/Ubuntu/Command Prompt (skip this step if you are already familiar with the command line)

- Opening the Application
  - If you are using a Mac, open up the terminal.
  - If you followed the recommended installation instructions for Windows and are using Ubuntu, open Ubuntu.
  - If you chose to run EXOTIC natively on Windows, open Command Prompt.
- Changing Directories
  - A “directory” is just another term for a folder in your computer
  - To enter a directory in terminal, type “cd” (“dir” for those using Command Prompt) followed by a space, and then the path to your directory, and then hitting return which will execute the command
    - The path to the folder you want to change into can be found by right clicking on the folder in Finder, and then holding down the option key, and then selecting “Copy ‘Your file’ as Pathname”
    - Pasting that copied file path after the “cd” is the easiest way to accurately and reliably change into your desired directory
  - To go back to your “Home” directory, simply type “cd”, or “dir” for Native Windows Users and then hit enter
  - “pwd” can be used to determine your current directory
- Listing Files in a Directory
  - To list all of the files in your current directory, enter “ls”
  - This is a good way to make sure that a/e file you are looking for is actually in the directory you think it is
- Keyboard Interrupt
  - To kill a process or program while its running, hit “Ctrl + c”
- Quitting the Application
  - To quit the terminal, after you have killed any processes that were running using the keyboard interrupt, type exit and hit enter
  - It is at this point you can simply close the terminal window by clicking on the red button in the top left corner of the window

### II. Getting the Code to Run

If you are using a Mac or Ubuntu:

1. Change into the directory in which “exotic.py” is located using Terminal
2. Type “python3 exotic.py” and then hit enter
3. If you see the EXOTIC header, the pipeline is running!

```
mjs2369@DESKTOP-R2PG3MN: /mnt/c/Users/Marlena Smith/Desktop/ExoplanetWatch/EXOTIC
mjs2369@DESKTOP-R2PG3MN:/mnt/c/Users/Marlena Smith/Desktop/ExoplanetWatch/EXOTIC$ cd /mnt/c/Users/Marlena Smith/Desktop/ExoplanetWatch/EXOTIC
mjs2369@DESKTOP-R2PG3MN:/mnt/c/Users/Marlena Smith/Desktop/ExoplanetWatch/EXOTIC$ python3 exotic.py
Importing Python Packages - please wait.
Thinking -WARNING (theano.tensor.blas): Using NumPy C-API based implementation for BLAS functions.
Thinking -

*****
Welcome to the EXOplanet Transit Interpretation Code (EXOTIC)
Version 0.7.5
*****

Enter "1" for Real Time Reduction or "2" for for Complete Reduction:
```

If you are using Command Prompt:

1. Change into the directory in which “exotic.py” is located using Terminal
2. Type “ipython” and then hit enter
3. Type “run exotic.py” and then hit enter

#### 4. If you see the header for EXOTIC, the pipeline is running!

```
IPython: C:\ExoplanetWatch\EXOTIC
C:\Users\Marlena Smith\Desktop\ExoplanetWatch>cd EXOTIC
C:\Users\Marlena Smith\Desktop\ExoplanetWatch\EXOTIC>ipython
Python 3.7.6 (default, Jan 8 2020, 20:23:39) [MSC v.1916 64 bit (AMD64)]
Type 'copyright', 'credits' or 'license' for more information
IPython 7.12.0 -- An enhanced Interactive Python. Type '?' for help.

In [1]: run exotic.py
Importing Python Packages - please wait.
Thinking /gzip was not found on your system! You should solve this issue for astroquery.eso to be at its best!
On POSIX system: make sure gzip is installed and in your path!On Windows: same for 7-zip (http://www.7-zip.org)!
Thinking /WARNING (theano.configdefaults): g++ not available, if using conda: `conda install m2w64-toolchain`
C:\anaconda3\lib\site-packages\theano\configdefaults.py:560: UserWarning: DeprecationWarning: there is no c++ compiler. This is deprecated and with Theano 0.11 a c++ compiler will be mandatory
  warnings.warn("DeprecationWarning: there is no c++ compiler.")
WARNING (theano.configdefaults): g++ not detected ! Theano will be unable to execute optimized C-implementations (for both CPU and GPU) and will default to Python implementations. Performance will be severely degraded. To remove this warning, set Theano flags cxx to an empty string.
Thinking /WARNING (theano.tensor.blas): Using NumPy C-API based implementation for BLAS functions.

Enter "1" for Real Time Reduction or "2" for for Complete Reduction:
```

After the program is running, you will first be presented with 2 options:

Enter '1' to Reduce your Data in Real Time

- i. This option should only be selected if you want to a quick reduction your data while you are on an observing run
- ii. This will simply serve as a visual tool, but will not fit a model lightcurve, nor will it extract planetary data

Enter '2' to do a Complete Reduction

- iii. The default option that should be selected at all times except for the case described in 1ai.
- iv. This performs a full reduction on all of your data
  1. See How it Works for an explanation of the reduction process

### III. Real Time Reduction Routine (skip this if you entered “2”)

Now that you have the pipeline running, this chapter will walk you through how to reduce your dataset in real time. The photos used below are using an example data set of HAT-P-32b.

1. Enter the directory path to the FITS Image Files
  - a. You will need to enter the complete path to the folder where the images you will be taking will get saved into

- i. If you don't have a folder in which your images will get saved, you will need to make one by simply creating a new folder using finder
  - b. The easiest way to get the path to your folder is by right clicking on the folder in Finder, and then holding down the option key, selecting "Copy 'Your file' as Pathname", and then pasting that into the terminal
2. Enter the name of the planet you are observing
  - a. For plot title only
3. Start Your Observing Run
  - a. Once you start your observing run, ".FITS" files should be entering the directory at the rate you set your observing cadence to.
4. Type "continue" after the first image has been taken and saved after the prompt
5. Entering the Pixel Coordinates of your Target Star
  - a. Go to: <http://nova.astrometry.net/upload>
  - b. Upload the first ".FITS" image in your in your dataset to Astrometry.net (left)
  - c. After it finishes analyzing your image click "Go to results page" (center)
  - d. Then click to download "new-image.fits" (right)

- e. Open "new-image.fits" in DS9, which should now be WCS encoded
    - i. To open a fits image with DS9, simply right click on the image in Finder, and select "Open With" and choose "SAOImageDS9"
    - ii. When opening for the first time, the system will say the application is by an unidentified developer. To get past this, open System Preferences and under the General pane of the Security & Privacy tab, you can allow the application under "Allow apps downloaded from:"
    - iii. Here is the User Guide: [DS9 User Guide](#) on their website
  - f. Search the SIMBAD database for your target star by typing its name into the search box
    - i. Link: [SIMBAD Search Portal](#)

- ii. Once you see a page like this one, with your target name, obtain the RA and Dec Coordinates (Green Box) and note the V-mag (Orange Box)

SIMBAD  with radius  arcmin

Interactive AladinLite view

FoV: 1.99'

☐ 2MASS ☒ DSS ☐ SDSS

- g. Find your target on the “new-image.fits” in DS9 by moving your cursor around on the image until the “fk5” values match the Ra and Dec values shown on the SIMBAD Database
- i. You can see stars more clearly by clicking “scale” → “zscale”

- h. When the FK5 values match the Ra and Dec from Simbad, the numbers in the boxes next to image (blue box) are the x and y pixel coordinates of your target

Move your cursor around the image (right) until your RA and Dec shown on the green box on the image match the values on SIMBAD

6. Entering the Pixel Coordinates of your Comparison Star
  - a. Return to the SIMBAD Page of your Star
  - b. Above the image of your target on SIMBAD, click on the “Interactive AladinLite View”
  - c. Check the box that says SIMBAD under “Catalogues”
  - d. Then click on the nearby stars (green circles) around your target star (purple +), looking for stars of similar brightness
  - e. Then in the “SIMBAD source” box on the left, check to make sure you have in fact clicked on a star by ensuring “main\_type” = Star
  - f. Then scroll down in the “SIMBAD source” box and check the number next to V. If it is close to the V-mag of your target star (within 1.5 units), you have likely found a good comparison star!
  - g. Obtain the “ra\_sex” and “dec\_sex” which are located in the “SIMBAD source” box (green arrow)
    - i. These are the RA and Dec values for your comp star

- h. Find your comparison star on your “new-image.fits” in DS9 using the same procedure you did for finding your target star. (step 4h)
- i. Enter the X and Y coordinates of your comparison star into your terminal.
7. A plot of Normalized Flux vs. Time (a lightcurve!) will be generated, and this plot will get updated every time a new image is added to the specified folder.
8. After you are done observing, either close out the plot, or quit the program by typing “Ctrl+c”

## IV. Complete Reduction Routine

Now that you have the pipeline running, this chapter will walk you through how to perform a full reduction of your dataset. The photos used below are using an example data set of HAT-P-32b.

1. Enter the directory path to the FITS Image Files
  - a. You will need to enter the complete path to the folder where the images you want to reduce are located
  - b. The easiest way to get the path to your folder is by right clicking on the folder in Finder, and then holding down the option key, selecting “Copy ‘Your file’ as Pathname”, and then pasting that into the terminal
2. Enter the directory path to the folder you want the results of the reduction saved into
  - i. If you don’t already have a folder where you want your plots saved into, you will need to make one by simply creating a new folder using finder in your desired location
3. Enter the name of the planet you are looking at and then the date (MM-DD-YYYY)
  - a. This information is just used to make plot titles. It is not relevant to the data reducing itself.
4. Enter the longitude and latitude in degrees of where you observed when prompted
  - a. These values are easy to find by simply googling it (an estimate is sufficient)

## 5. Locate Your Target Star

- Go to: <http://nova.astrometry.net/upload>
- Upload the first “.FITS” image in your in your dataset to Astrometry.net (left)
- After it finishes analyzing your image click “Go to results page” (center)
  - If the results shown in the figures do not appear, refresh the page.
- Then click to download “new-image.fits” (right)

The left screenshot shows the Astrometry.net upload page. A red box highlights the 'Select a file or url to upload' button. Below it, there are options for 'file' and 'url'. The middle screenshot shows the submission page for 'Submission 2778214'. A red box highlights the 'Go to results page' button. The right screenshot shows the image page for 'HATP-32171220013343.FITS'. A red box highlights the 'New FITS image: new-image.fits' link.

- Open “new-image.fits” in DS9, which should now be WCS encoded
  - One way to check is if the boxes next to the FK5 label in DS9 are no longer empty once you hover your cursor over the image
- Search the SIMBAD database for your target star by typing its name into the search box
  - Link: [SIMBAD Search Portal](http://simbad.u-strasbourg.fr/simbad/)
  - Use the name formatting from the source tweet
- Once you see a page like this one, with your target name, obtain the RA and Dec Coordinates (Green Box) and note the V-mag (Orange Box)

The screenshot shows the SIMBAD database search results for 'hat p 32'. The search bar contains 'hat p 32'. Below the search bar, there are buttons for 'other query modes', 'Identifier query', 'Coordinate query', 'Criteria query', 'Reference query', 'Basic query', 'Script submission', 'TAP', 'Output options', and 'Help'. The results show 'HAT-P-32 -- Star' with RA and Dec coordinates highlighted in green and V-mag highlighted in orange.

SIMBAD [query around](#) with radius 2 arcmin

- h. Enter the Ra and Dec in the form ‘###:###:###’
  - i. For example, in the example above, the Ra should get entered as 02:04:10 and the Dec as 46:41:16 (ignore the values after the decimal)
- i. Find your target on the “new-image.fits” in DS9 by moving your cursor around on the image until the “fk5” values match the Ra and Dec values shown on the SIMBAD Database
  - i. You can see stars more clearly by clicking “scale” → “zscale”
    1. Blue highlighted buttons in image below
  - ii. When the FK5 values match the Ra and Dec from Simbad, the numbers in the boxes next to image (blue box) are the x and y pixel coordinates of your target

Move your cursor around the image (right) until your RA and Dec shown on the green box on the image match the values on SIMBAD

- j. Enter the Target X and Y Image (pixel) position (Blue Box in image above) into the terminal when prompted
6. Decide how many comparison stars you want to use
    - a. 3 is recommended, but any number between 1-10 will do
  7. Entering the X and Y Pixel Coordinates of your Comparison Stars
    - a. Return to the SIMBAD Page of your Star
    - b. Above the image of your target on SIMBAD, click on the “Interactive AladinLite View”
    - c. Check the box that says SIMBAD under “Catalogues”
    - d. Then click on the nearby stars (green circles) around your target star (purple +), looking for stars of similar brightness

- e. Then in the “SIMBAD source” box on the left, check to make sure you have in fact clicked on a star by ensuring “main\_type” = Star
- f. Then scroll down in the “SIMBAD source” box and check the number next to V. If it is close to the V-mag of your target star, you have likely found a good comparison star!
- g. Obtain the “ra\_sesa” and “dec\_sesa” which are located in the “SIMBAD source” box (green arrow)
- i. These are the RA and Dec values for your comp star

- h. Find your comparison star on your “new-image.fits” in DS9 using the same procedure you did for finding your target star. (step 4h)
- i. Enter the X and Y coordinates of your comparison star into your terminal.
- j. Repeat steps 5b through 5j until you have entered the coordinates for each of the comparison stars you wanted to use
8. When asked if you have calibration images (flats, darks, or biases), enter ‘y’ if you have them, otherwise enter ‘n’
  - a. If you don’t know, or aren’t sure what they are, you probably don’t have them and should enter ‘n’ and the code will take you to step 8.
  - b. For each type of calibration image you have, enter the directory path to where each set located when prompted
9. Enter the Planetary Parameters for Lightcurve Fitting
  - a. Go to the NASA Exoplanet Archive look up
    - i. Link: [NASA Exoplanet Archive Search](https://exoplanetarchive.ipac.caltech.edu/)
  - b. Enter the name of your target star in the search bar under “Host Name” then click on its name once you have found it
    - i. The site is case sensitive so be careful with capitalization
    - ii. It should open a site that looks like the image shown at the bottom of page

- c. The code will iterate through each parameter it needs and will attempt to scrape the values off of the Exoplanet Archive website
- d. It will then prompt you to verify that each parameter is correct
  - i. Parameters: Orbital Period, Mid-Transit Time, Eccentricity, Ratio of Planet to Stellar Radius, Ratio of Distance to Stellar Radius, Orbital Inclination (all boxed in green in the image below)
  - ii. For Mid-Transit Time, you want to pick the largest value in the column and its corresponding uncertainty (the values after the  $\pm$ ).
  - iii. For everything else, pick the value highlighted in gold if it's available, and then go to the most recently published non-null value if it's not
- e. For each parameter it asks if you agree for, if the value the code obtained is not the same as what you see on the Archive, type 'n', and then enter the correct value when prompted

## 10. Limb Darkening

- a. On the NASA Exoplanet Archive page of your planet, scroll down until you reach the section called “Summary of Stellar Information”

Summary of Stellar Information			
Right Ascension	02h04m10.28s	Declination	+46d41m16.2s
Galactic Longitude (deg)	135.69859	Galactic Latitude (deg)	-14.37298
Parallax (mas)	3.4304647653712994±0.0623970254391056	Distance (pc)	291.50569045176132±5.30222265110304
RA Proper Motion (mas/yr)	-9.8±0.1	Dec Proper Motion (mas/yr)	3.5±0.1
Total Proper Motion (mas/yr)	10.4±0.1	Radial Velocity (km/s)	-23.21±0.26
B-band (mag)	null	K-band (mag)	9.990±0.022
Spectral Type	null	Effective Temperature (K)	6207±88
Surface Gravity (log <sub>10</sub> (cm/s <sup>2</sup> ))	4.33±0.01	Luminosity (log <sub>10</sub> (L <sub>sun</sub> ))	null
Radius (R <sub>sun</sub> )	1.19±0.10	Mass (M <sub>sun</sub> )	1.09±0.28
Density (g/cm <sup>3</sup> )	0.91±0.06	Age (Gyr)	null
Metallicity (dex)	-0.04	Metallicity Ratio	[Fe/H]
V sin(i) (km/s)	20.7±0.5	S-index	null
log R'HK	null	X-ray activity, log(L <sub>x</sub> )	null
Number of Hipparcos Light Curves	0	Number of Photometric non-Hipparcos Light Curves	0
Number of Radial Velocity Time Series	0	Number of Amateur Light Curves	0
Number of Spectra	0	Number of Images	3

- b. Similar to how you entered the planetary parameters in step 8, the code will once again ask you to verify that the values it scrapes from the Archive are correct
    - i. It will ask for the Effective Temperature (green box), the Metallicity (red), and the Surface Gravity in the log(g) box (yellow)
11. Now that you have entered all the necessary information, the code will then reduce the dataset
12. After the reduction component is done a set of plots are generated and saved into your specified directory
  - a. The target star's raw time varying flux (see How it Works sect...)
    - i. Figure name: 'TargetRawFlux<planet name><date>.png'
  - b. The comparison star's raw time varying flux
    - i. Figure name: 'CompRawFlux<planet name><date>.png'
  - c. The Normalized Target Flux as a function of phase
    - i. Figure name: 'NormalizedFluxPhase<planet name><date>.png'
13. The code uses an MCMC to fit a model light curve to your data, fitting for airmass, mid transit time, and planet radius
  - a. Warning: this will take some time. Usually around 30 minutes
  - b. For explanation, see How it Works: Full Lightcurve Fitting Routine
14. Final Light Curve fitted with a model is generated and saved in your specified directory
  - a. Figure name: 'FinalLightCurve<planet name><date>.pdf'

15. The final planetary parameters of Mid Transit Time and Ratio of Planet to Stellar Radius and their corresponding uncertainties will be displayed in the terminal, and also saved as a '.txt' file in your specified directory
  - a. Figure name: 'FinalParams<planet name><date>.txt'
  - b. To learn how to interpret your results, go to "How it Works: Results Interpretation"
16. If you want to save your reduced data into the official AAVSO data format file, type 'y' when prompted
  - a. Enter your AAVSO Observer ID
    - i. If you don't have an Observer ID, it's probably because you haven't created an account, which can be done at:  
<https://www.aavso.org/apps/register/>
  - b. Enter your exposure length in seconds
    - i. This is simply how long you exposed for when you took the data
    - ii. It often can be found by opening one of the images in DS9, and then going to File -> Display Header
  - c. Enter the binning used on your camera
    - i. If you don't know or are unsure, just type '1x1'
  - d. The file should now be saved as "AAVSO<target name><date>.txt"
